

Statewide build — status as of 13 Sep 2026

Companion to `wilson-situs-prototype-state.md` and `situs-platform-plan.md`. This is the “county as config” plan executed end to end: all 95 Tennessee counties have been run through one pipeline on public data only, with no confidential DOR roster and \$0 spent on data.

Published pages

- **Tennessee Situs Atlas** (statewide index, links to every published workbench):
<https://claude.ai/code/artifact/9ff0b320-ff3f-40d2-8161-9d31608705ea>
- County workbenches (operator console: map, evidence packets, shared adjudication, DOR-file paste):
 - Wilson <https://claude.ai/code/artifact/24f8283d-87ab-4811-a54b-c55d799e15d4>
 - Sumner <https://claude.ai/code/artifact/b69a5dc6-072c-49be-b5e5-4aecfbdf16e6>
 - Rutherford <https://claude.ai/code/artifact/4dadc775-c33a-459f-b56a-2136da0c214c>
 - Davidson <https://claude.ai/code/artifact/e6691a63-1d35-4fab-80d8-f0f342e20cee>
 - Shelby <https://claude.ai/code/artifact/d9d149a2-f81b-4de7-b497-81f5b543789a>
 - Knox <https://claude.ai/code/artifact/572e8b0f-f606-4443-bf62-3f72ca17ac43>
 - Hamilton <https://claude.ai/code/artifact/560ebc94-81e0-4f63-a9d0-0f5fcba9a37b>
 - Williamson <https://claude.ai/code/artifact/4249e6c7-94bd-411d-a926-f9b44d0a626e>
 - Montgomery <https://claude.ai/code/artifact/ba8e60f0-ea6a-4996-b5e2-81a2a77c16b7>
 - The other 86 are built (`artifact/<slug>/`) and can be published on demand; nothing about them is different, they are just not yet given a URL.
- Wilson County Situs Control (report page): <https://claude.ai/code/artifact/ce5e7367-3f04-45e1-b66f-69783f3b1622>

Statewide totals (public data, rubric v2)

Measure	Value
Counties run	95 / 95 (0 failures)
Rooftops placed in DOR situs polygons	3,943,392
Business points (SOS entities + E-911 labels, rooftop-geocoded)	323,007 across 76 counties
Jurisdictional seam miles	18,246 (9,298 cross-county)
Cross-county postal businesses (both halves of the tax at risk)	1,089
Boundary-risk businesses (≤ 250 ft of a seam)	9,691
Postal-city exposure businesses	49,305
DOR file $\neq$ DOR polygon (E5, > 250 ft)	55,092 rooftops
Official-layer disagreement (E4)	19,111 rooftops

Top counties by business universe: Davidson 58,067 · Knox 39,862 · Rutherford 39,802 · Shelby 39,598 · Williamson 25,919 · Hamilton 21,201 · Sumner 14,974 · Wilson 13,006.

Highest cross-county-postal counts: Shelby 232, Wilson 136, Rutherford 75, Hamilton 51, Davidson 28.

What was built this pass

- Chrome-driven pull of every county's NG911 address points and DOR SST address ranges (91 counties, 3.11M points, 1.97 GB, 0 errors) into `data/raw/` on Dan's Mac, staged into the warehouse with SHA-256 provenance and dated, never-overwritten snapshots.
- `configs/<county>.yaml` for all 95 (generated from the DOR polygon layer; Wilson, Sumner, Rutherford, Davidson hand-enriched; Moore and Trousdale metro merges; Davidson 1900→1901 dissolve).
- `configs/postal_home_county.json` now derived from **all 95 counties** (654 postal cities, 2,910 city/ZIP pairs, 93 multi-county postal cities). Cross-county postal (E2) is computed from this statewide map, not a hand-typed list — this replaced the provisional 4-county map and every county was re-run against it.
- Workbench queue banner: with no roster loaded the queue is labelled **ranked exposure, not findings**; once a DOR file is pasted it flips to findings mode with the Coded ≠ measured class.
- SST fallback for 911 authorities that leave ZIP blank (DeKalb: 0.5% → 82.8% address-range match).
- Atlas marks the 19 counties with no Secretary of State entity file as “no roster yet” rather than 0.

Known gaps

- **19 counties have no SOS entity file yet** (business layer empty; rooftop analysis is complete): Blount, Chester, Cocke, Decatur, Fentress, Greene, Hardeman, Hickman, Humphreys, Johnson, Loudon, McNairy, Meigs, Monroe, Rhea, Robertson, Tipton, Van Buren, Washington. Pull the TN SOS county entity TSVs for these and drop them in `data/sos/`; `fetch/make_configs.py` wires them.
- Low DOR address-range match rates worth a look before selling those counties: Obion 26%, Unicoi 27%, Cocke 36%, McMinn 41%, Marion 51%. Probably street-name conventions in the 911 layer.
- Knox and Williamson show 0 cross-county postal — plausible (Knoxville and Franklin postal areas are home to their counties) but verify on the first roster.
- Wilson E5 (DOR file ≠ polygon) is 12,691 — highest in the state relative to size; this is the “counter-finding in the county's favour” already documented for Wilson and should be in the engagement letter.

Where everything lives

- Code, configs, docs, deliverables (Word/PDF), per-county summaries, bulletins, exception CSVs, seams, and the nine published workbenches are synced to `~/Downloads/civvix-wilson-situs/` on Dan's Mac (zips in `_sync/`, already extracted in place). Raw layers are in `data/raw/` there.
- The cloud workspace holds the full warehouse (`warehouse/raw/. . .`) and all 95 `out/<slug>/` and `artifact/<slug>/` directories for this session.
- Weekly boundary-change watch: scheduled task “Situs boundary-change watch (weekly)”, Mondays 13:00 UTC, writes `claudesitus-watch-state.md`.

Next

1. Wilson meeting (week of 14 Sep): demo the Wilson workbench and the atlas; walk the queue banner.
2. Fill the 19 missing SOS files; rerun those counties (`python3 run_all.py --skip-ingest --counties ...`).
3. First roster paste (Wilson) → `calibrate.py` → confusion matrix in the bulletin.
4. Municipal packages: every city already has a situs code and a polygon in the atlas; the county-and-cities package (doc 09) needs only the city list per county from `configs/`.
